PLACAS SIN AMIANTO: El desarrollo de una placa de freno se adapta a las características del vehículo y a la configuración del sistema de frenado definido por el fabricante de automóviles.

Los conocimientos y experiencias de Bendix le permiten fabricar placas de turismo SIN AMIANTO garantizando un producto de calidad. El abandono de los productos con amianto en favor de los productos sin amianto responde a un objetivo de salud pública y a la legislación actual.

FUNCIÓN: En los vehículos de turismo, el frenado se obtiene por fricción de un material (placas de freno) sobre otro material (disco de freno). La guarnición de fricción es un producto de seguridad.

LA VENTAJA COMERCIAL	FUNCIONES	VENTAJAS
Antiruido.	Absorbe las vibraciones.	Elimina o reduce el "silbido" de las placas de freno.
Resortes.	Fijan la placa en la pinza.	Eliminan el golpeteo de las placas sobre el estribo.
Indicadores de desgaste.	El testigo luminoso indicador se enciende cuando quedan 2 mm de guarnición.	Se deben reemplazar las placas antes de que el disco se deteriore.

DESGASTE: Hay un límite de desgaste de las placas de freno. En ningún caso debe llegarse al soporte metálico, pues deterioraría muy rápidamente el disco.

Se deben reemplazar las placas cuando la guarnición tenga un espesor de sólo 2 mm.

"FADING": El "fading" es una caída brutal del coeficiente de fricción de la placa en relación con el calentamiento de la guarnición. Cuando se presiona el pedal, la eficacia de frenado ya no está en relación con la presión aplicada. Cualquiera que sea la temperatura de la placa, el coeficiente de fricción debe permanecer constante.

CONSEJO: Al montar placas nuevas, es indispensable reemplazar todos los accesorios suministrados en el embalaje de las placas Bendix (ejes, clavijas, muelles). Se recomienda rodar las placas de freno durante 200 kilómetros.

DIAGNÓSTICO	INTERVENCIONES
La cristalización de las placas consiste en transformar la superficie de la guarnición y del disco de freno. Aspecto del Disco: barnizado y azul.	Reemplazar los discos y las placas de freno.
Ciertas placas pueden presentar un inicio de división spaccatura. Se trata de la presencia de una ligera fisura paralela al soporte metálico.	Esta división ocasiona el desgarre de la guarnición. Reemplazar entonces las placas.
Presencia sobre la superficie de la guarnición de un surco que muestra que hay una protuberancia sobre el disco de freno.	Reemplazar las placas y el disco. En ningún caso se debe achafanar la placa de freno para adaptarla al disco.
En ciertas placas de mala calidad, hay un inicio de desprendimiento de la guarnición con respecto al soporte metálico. Este desprendimiento favorece la oxidación del soporte metálico, lo que puede ocasionar el desprendimiento completo de la guarnición.	Reemplazar las placas de freno.
La presencia de una protuberancia sobre la placa de freno indica que ésta está incorrectamente situada sobre el plano vertical. Esto puede deberse a un montaje incorrecto o a un defecto de la guarnición sobre su soporte.	Reemplazar las placas de freno. Al montarlas, verificar que la guarnición no sobrepase el disco.
La presencia de una gran protuberancia sobre las 2 placas puede ocasionar una pérdida total de eficacia	Problema relacionado con la geometría de la guarnición, que está mal adaptada. Reemplazar las placas.

Cada vez que se presiona el freno, el disco sufre una importante agresión y debe responder a exigencias técnicas muy elevadas: se trata pues de un producto muy sensible, y por tanto, el desgaste anormal de los discos disminuye la seguridad del frenado.

FUNCIÓN: En los vehículos de turismo, el frenado se obtiene por fricción de un material (placa de freno) sobre otro material (disco de freno).

**UN JUEGO DE DISCOS... CADA 3 JUEGOS DE PLACAS DE FRENO
(ó cada 50.000 a 70.000 km.).**

LA VENTAJA COMERCIAL	FUNCIONES	VENTAJAS
La materia prima del disco de freno está hecha de fundición gris perlfica para usos "normales".	La fundición resiste al desgaste abrasivo y permite temperaturas desiguales.	Obtener frenados de calidad que garanticen seguridad y durabilidad.
Estado de superficie: "rectificado del disco en el torno".	Técnica de rectificado que sirve para reducir la arista y la variación de espesor del disco a valores que alcanzan hasta la milésima de milímetro.	Evita la pulsación del pedal de freno y el riesgo de deteriorar la pinza.
Ranura entre el cubo del disco y la zona de frenado.	La tecnología de la ranura permite bloquear el calor.	La ranura tiene dimensiones y una forma adecuada que reducen al mínimo la deformación del disco.

DESGASTE: Se deben reemplazar los discos de freno cuando el espesor sea inferior a la cota mínima teórica grabada sobre el canto del disco (marcado M.TH ...), así como en nuestro catálogo.

CONSEJO: Al reemplazar las placas, se deben controlar los discos de freno. Se recomienda reemplazar los discos y las placas para garantizar la máxima eficacia de frenado. Rodar las placas y los discos nuevos durante 200 kilómetros.

IMPORTANTE: Se debe obligatoriamente reemplazar los discos por parejas para evitar un funcionamiento irregular durante el frenado.

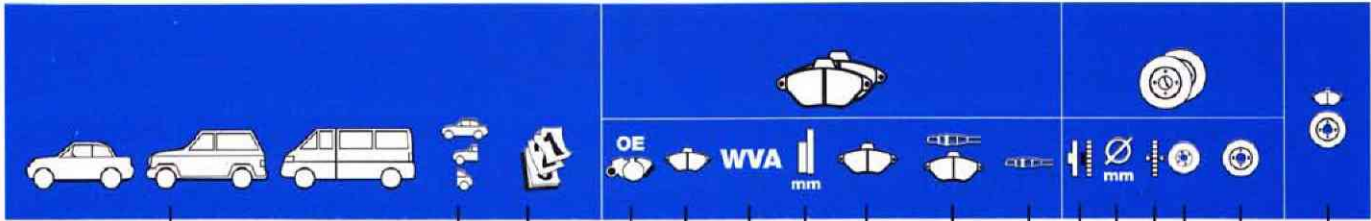

DIAGNÓSTICO	INTERVENCIONES
Presencia de una protuberancia sobre la periferia del disco de freno.	Reemplazar las placas y el disco. En ningún caso, se debe achafanar la plaqueta de freno para adaptarla sobre el disco.
La cristalización de las placas de freno consiste en transformar la superficie de la guarnición y del disco de freno. Aspecto del disco: barnizado y azul.	Reemplazar los discos y las placas de freno.
Estado de la superficie del disco: rayaduras, fisuras.	Reemplazar los discos y las placas de freno.

EFEECTO DE PULSACIÓN EN EL PEDAL DE FRENO

DIAGNÓSTICO	INTERVENCIONES
Verificar el asentamiento del disco: nunca debe exceder el valor máximo definido de 0,08 mm.	Reemplazar los discos o, cuando la tecnología de montaje del disco lo permita, buscar la posición del asentamiento.
Verificar la superficie del buje, el valor máximo no debe exceder 0,02 mm.	Reemplazar el buje.
Verificar la diferencia de paralelismo entre las 2 caras del disco, el valor no exceder 0,02 mm.	Reemplazar los discos.
Un apriete excesivo de las ruedas o una limpieza incorrecta de las superficies de apoyo disco/buje son a menudo la causa de una acentuación del velo de los discos.	Reemplazar los discos y apretar las ruedas al par correcto mediante una llave dinamométrica.

Los valores indicados en el presente documento sólo son valores indicativos. En caso de duda, remítase a las indicaciones del fabricante.
